Input Utility

Signal Normalizing

làrachd provides multiple methods of interfacing external signals and interactions into musically useful control voltage signals.

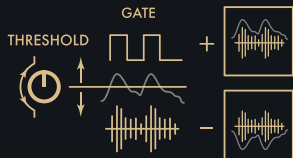

Waveshape / Enhance

An audio enhancement circuit provides emphasis to audio signals through a combination of waveshaping and limiting.

Envelope Follower with threshold comparator

Line level audio sources or ambient sounds convert to control voltage envelopes and gates.

Dual Footswitch Controller Interface

The làrachd's dual footswitch controller produces combinations of gate and trigger signals. This allows for precision hands-off control over performance patches.
